**Mentor Meeting 1 Agenda**

**Topics for discussion:**

- How do users search for an exchange?
  - Search by Language - Leaning towards this one because we can keep it a simple search box with autocomplete, and it also simplifies our data model
  - Buttons - For this, users will update what languages they are interested in, and just have to click a button for the language they want to chat in. This adds elements to the data model
- How to save chats
  - Don't save them at all
  - Save them in one big chat (like Facebook chat) - users can go back in their conversation to the beginning of time
  - Save them by conversation - Leaning towards this one because it goes well with our implementation, since exchanges happen in real time, one at a time. If we go with this we have another decision to make.
    - List past chats by user first, then time
    - List past chats by time only
    - List past chats by language, then user, then time - Leaning towards this one
- General Questions about MVP vs Final
  - Profiles Pages and alliances necessary for MVP? For final?
  - How much effort should we put into UI for MVP?
  - Reporting is definitely necessary for final, but is it necessary for MVP?
- Suggestions for actually coding together?
  - Code reviews?
  - Partner programming?
  - How to code so final combination of implemenations goes smoothly?
  - Git protocol suggestions?
- General input on design?
